Branka Lalic (Serbia) for providing some slides**

Agrometeorology
plays an increasing important role
in agriculture and food production !

Why?
Global change
leads to
higher risks in agricultural production
and less resources for more people.

The top 100 questions of importance to the future of global agriculture

J. Pretty et al., *Int. J. Agric. Sust.* 8(4), 2010, 219–236

Agriculture unprecedented combination of drivers is **population growth**, dietary shifts, **energy and resource insecurity**, **climate change** and variability.

The goal is no longer simply to maximize productivity, but to optimize across a far more complex landscape of production, rural development, environmental, social, economic outcomes.

Synergies and dialogue between policies, social, environmental, economic are fundamental to prioritize investments and research efforts.

Impacts of climate change on agriculture - World

- physiological effects on crops, pasture, forests and livestock (quantity, quality);
- changes in land, soil and water resources (quantity, quality);
- increased weed and pest challenges;
- shifts in spatial and temporal distribution of impacts;
- sea level rise, changes to ocean salinity;
- sea temperature rise causing fish to inhabit different ranges.

socio-economic impacts:

- decline in yields and production;
- reduced marginal GDP from agriculture;
- fluctuations in world market prices;
- changes in geographical distribution of trade regimes;
- increased number of people at risk of hunger and food insecurity;
- migration and civil unrest.

FAO, 2007

in cooperation with Institute of Meteorology, BOKU

The top 100 questions of importance to the future of global agriculture

2600 Km³ globally withdrawn to irrigation: in some Countries 80% of water resources are diverted to agriculture (share variable), with increasing competition for urban and industrial usage. In some Country the importance is such that in absence great economic hardship would occur with potential for land abandonment.

Increasing demand (rising population, rising incomes, diet shifts to more water-intensive products) and uncertainties (climate).

Interventions required across scales: field – communities - watershed, catchments - river basins with focus to increase “green” and “blue” water productivity.

How to optimize the allocation (agriculture, environmental functions)?

What approaches to develop to increase water-use efficiency, and their cost-effectiveness?

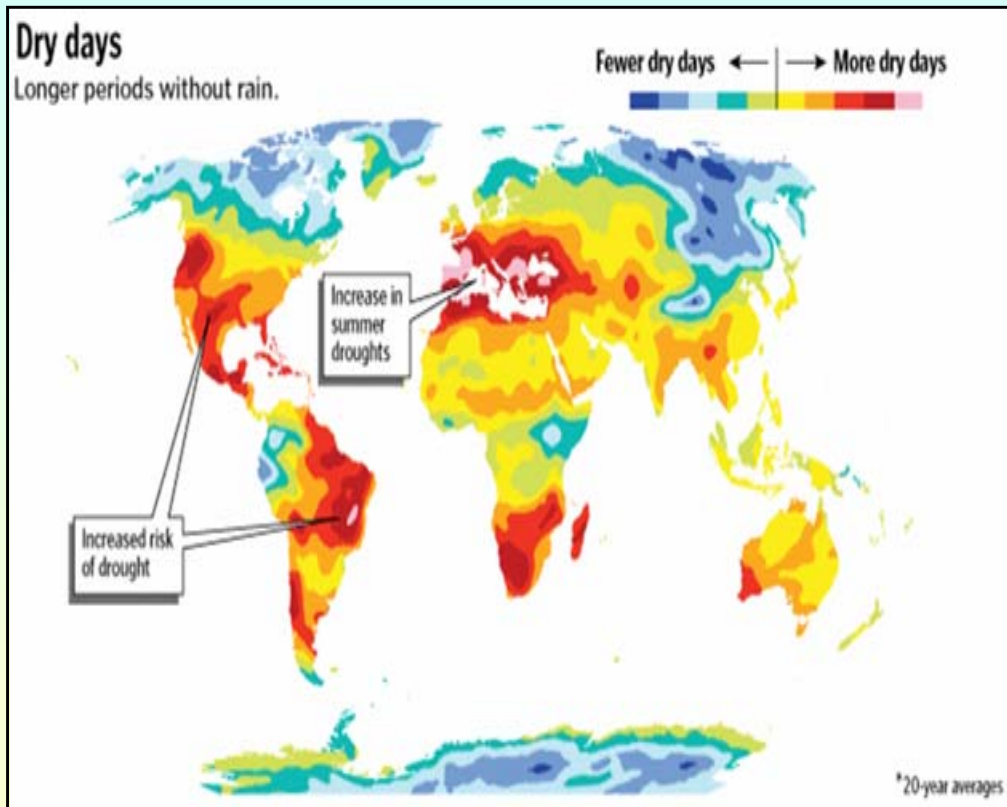

Water footprint (Mutti)

1 kg tomato: 156 l H₂O

1 kg tomato souce: 557 l

Effect on rain days

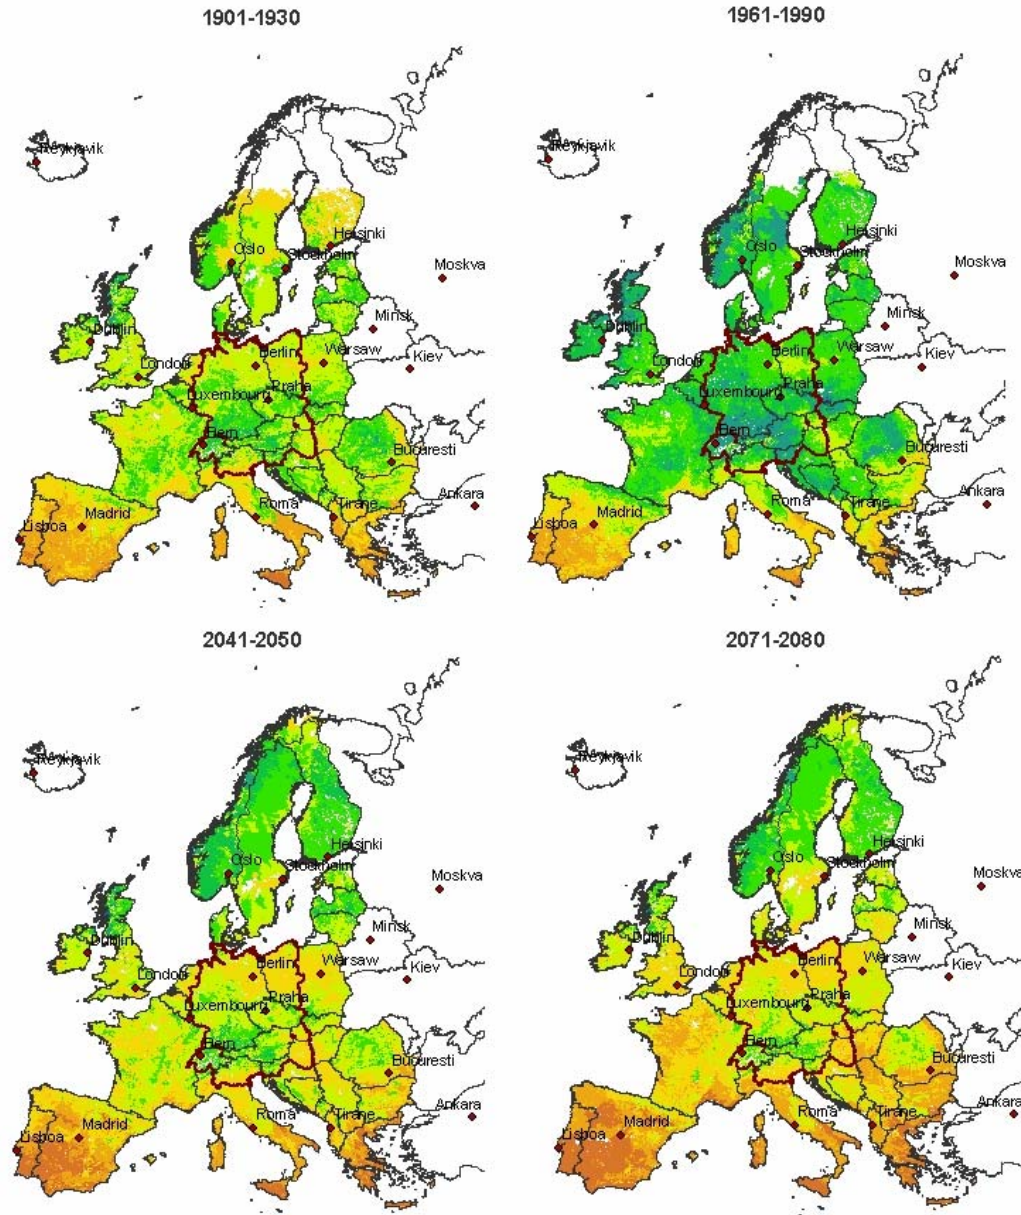

- Increased drought risk
- Increased erosion risk
- Increased risk of within season drought
- Reduced growing season (too dry)
- Increased average temperatures

Change in days with crop water stress in summer (Mai-September)

Crop Model: ROIMPEL

Tage mit Wasserstress in der Vegetationsperiode

Weeds : Example Ambrosia

(Eitzinger et al., 2009)

The top 100 questions of importance to the future of global agriculture

Markets and consumption: food supply chain, food standards, LCA, energy, C footprint, environmental impact.

As energy prices rise, how can agriculture increase its efficiency and use fewer inputs to become economically sustainable and environmentally sensitive, yet still feed a growing population?

Agricultural development: networking, solidarity, reciprocity and exchange, farmer participation in technological development.

Farmers involvement enables novel technologies and practices to be learned directly, adopted and adapted. Agricultural, Weather, Climate, Water Services services are vital elements to address needs and provide support and critical advises.

Main classes of adaptation (short and long term)

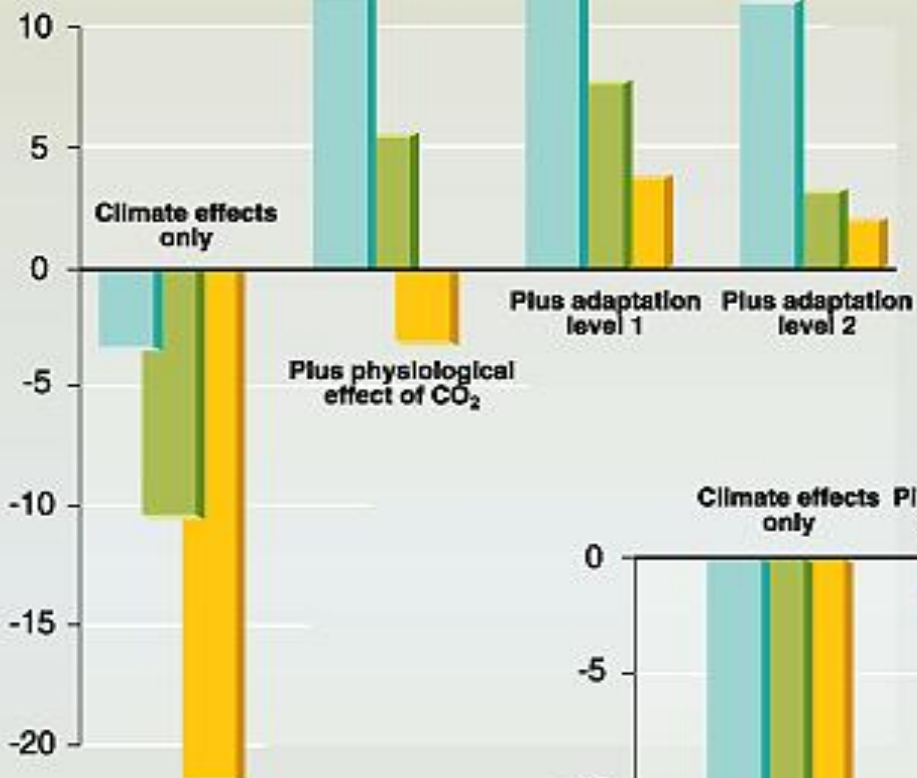

- seasonal changes and sowing dates;
- different variety or species;
- water supply and irrigation system;
- other inputs (fertilizer, tillage methods, grain drying, other field operations);
- new crop varieties;
- forest fire management, promotion of agroforestry, adaptive management with suitable species and silvicultural practices (FAO, 2005).

Accordingly, types of responses include (*ibid.*, p. 770-771):

- reduction of food security risk;
- identifying present vulnerabilities;
- adjusting agricultural research priorities;
- protecting genetic resources and intellectual property rights;
- strengthening agricultural extension and communication systems;
- adjustment in commodity and trade policy;
- increased training and education;
- identification and promotion of (micro-) climatic benefits and environmental services of trees and forests (FAO, 2005).

FAO, 2007

Developed countries

Change in cereal production under three different GCM equilibrium scenarios in percent from base estimated in 2060

World total

Developing countries

Notes: Level 1 adaptation included changes in crop variety but not the crop, the planting date of less than 1 month, and the amount of water applied for areas already irrigated. Level 2 adaptation additionally included changes in the type of crop grown, changes in fertilizer use, changes in the planting of more than 1 month, and extension of irrigation to previously unirrigated areas.

Low input system solutions (dominating in developing countries)

- Including knowledge on adapted traditional (indigenous) techniques or methods
- New low cost "high technology" (e.g. pumps, sensors, ...)
- Interactions with structural changes : Increase farm production flexibility (mixed farming, agroforestry, Increase of institutional support (micro insurances, ...))

PHOTO 80
A woman fertilizing a crop field with great care and precision (Kenya)

A simple pump, powered by one person, can irrigate acres of land easily. These pumps, produced by Approtec, are inexpensive and efficient.

Expected adaptation levels

In the light of expected impacts, which are the best hypothesis of changes in management ?

	MDS	MDN	ALS	CON	BOR		ATC	ATN
Timing of field operations	1	2	1.5	1.4	3		1	0.9
Changed cultural practices	1	2	1.75	1.3	3		1	0.9
Changed fertilisation	1	1	1.75	1.5	2		1	1.5
Changed crop protection	2	2	1.25	1.7	3		1	1.4
Cultivars adapted to warmer and drier	1.5	0.5	2.5	2.2	2		1	1.0
Soil water saving technologies	3	2	1.5	2	1		1	0.5
Soil erosion and fertility protection	1	2	1.5	1.4	2		1	0.9
Monitoring drought, pests and diseases	3	3	2.5	2.2	3		1	1.0
Use of seasonal weather forecasts	3	3	2	1.75	3		2	
Crop insurance	0	0	1.75	1.9			1	
New (warm season) crops	2	2	2	2.2	2			3.0
Crop rotations for better water use	2	2	2.5	1.9	1			1.0
Crop rotations for better nutrient use	1	1	2.5	2.1	2			2.0
Expansion of irrigation systems	3	2	2	1.8	3			0.0
Improvement of irrigation systems	3	3	2	1.5	3			0.0
Regulation of water rights for irrigation	3	3	2	1.8				0.0
Microclimate modification	3	3		1.5				0.0
Landscape changes			1	1.6	1			2.0
Revised environmental regulations			2	2	3			2.0
Revised subsidy schemes	0	0	2	2	0			

Infrastructure, institutional support, insurance,...

Farm technology and methods

Crop yields,
food production

Food quality

Farmers income

Landscape functions,
biodiversity

Risk
of production ...

Improving, optimising,

.... by increasing the efficient
use of inputs
(fertilizer, machinery, ...)
and natural resources
(soil, water, crop,
microclimate)

But is that
always sustainable ?

Challenges for operational agrometeorological application and future research

- **Monitoring activities:**

Real time and forecasts (drought, extreme weather etc.)

- **Decision Support Systems:**

Application and user oriented, economic, short and long term focus

- **Climate Mapping:**

High spatial resolution, considering climate change and crop specific aspects

- **Improving and combining the tools:**

Remote Sensing, GIS, agrometeorological , crop and irrigation models, measurement systems, data transfer and processing etc.
